

Exo Handcuff Cases

Secure. Fast. Tough. The three criteria that form the foundation of the Exo Handcuff Case.

Carriers are based upon the most advanced structural design, an exterior skeleton. Strength of the Exo comes from this outer frame. The interior of the Exo is open, clean and accessible. A contoured silicone pad in the base of each case cushions the restraint and prevents cuff rattle. The Exo design provides the most secure retention of any commercially available handcuff carrier. Release is smooth and rapid.

Handcuffs are retained in the Exo by a two stage security lock. A release button must be pressed in and slid downward. Once unlocked, restraint access is rapid and direct. Handcuffs come straight out from the side of the case into the hand. It is the most rapid restraint access in the industry.

Exo Case bodies are precision molded from the same high strength polymer used in ASP baton scabbards. They are simple, strong, ergonomic and compact. The material will maintain a professional appearance on the duty belt or tactical vest.

Exo . . . Strength through Structure

CHAIN-HINGE EXO CASE

RIGID EXO CASE

Background

High strength polymer
Precision molded
Interchangeable base pad
Left or right carry
Two stage release

Specifications

Chain · Hinge		
Length	4.25"	108 mm
Width	3.25"	82.5 mm
Rigid		
Length	9"	229 mm
Width	3.45"	87.6 mm
